

Hearing Loop

What is a hearing loop?

A hearing loop is a device that allows hearing aid and cochlear implant users to hear sound directly into their hearing aids. It also mutes background noise, resulting in clear sound.

How do I use the hearing loop?

1. **Stand in front of the portable hearing loop.**
2. **Turn your hearing aid or cochlear implant to the T-Coil program.** If you don't have the T-Coil program set up, or if you aren't sure, speak with your audiologist.

Once you turn on the T-Coil program, you should be able to hear the speaker who is using the microphone.

If you don't have a hearing device with a T-Coil, or if you don't have a hearing device but would benefit from clearer sound, you can use the headphones provided
